Abstract (en)

[origin: EP0404045A1] In a textile machine (1) with a plurality of work stations, bobbins of identical yarn length are to be produced. After the completion of the winding travel, the yarns (8) are guided simultaneously into the interception region of a suction device (27) and are cut there simultaneously by a cutting device (34). The winding devices (2) are operated at crawling speed. After the bobbin change, the yarns are attached again and the speed increased to the operating speed. <IMAGE>
