Abstract (en)

[origin: EP0404088A2] The invention relates to a device for feeding the inking unit of a printing press with a mixed ink. It is mixed continuously from its basic colours and fed to the inking unit so that the step of ink mixing as a production preparation prior to a printing order is omitted. The parts filled with the mixed ink after a printing order are constructed as demountable exchange articles. By this means, the equipment can be converted to another colour with a short conversion time. <IMAGE>
