Abstract (en)
A washing machine (10) with a substantially cylindrical horizontal tub (11) containing the washing liquid, within which rotates a peripherally perforated drum (12) containing the washing, comprises an aperture in the lower portion of the lateral wall of the tub 11, to which is tightly secured an intake duct (13) of a pump (14) whose delivery is conveyed to at least one duct (16, 17) which passes tightly through a substantially lower portion of the tub 11 in order to send jets of washing liquid, sucked up from the tub (11), against the perforated wall of the drum (12), when the pump (14) is actuated, so as to create water pressure against the washing contained in the drum (12).
