Abstract (en)

[origin: EP0404725A2] The goods display device has bearing devices which receive slide devices, the latter being displaceable in the longitudinal direction in a C-shaped profiled rail (1, 1.1) and being engageable at given support points (10), for the attachment of goods. These slide devices are designed as blocking locks (3) which can be pushed into the interior of the profile from the front through the profile opening and contain blocking jaws (9) which are mounted transversely displaceably in a lock housing (8). The blocking jaws (9) are displaceable optionally from an extended blocking position, in which they project over the side walls (8.1) of the housing and, together with the support points (10), define engagement points for the bearing devices, into a running position, in which the lock housing (8) is freely displaceable in the C-shaped rail (1, 1.1). <??>The blocking lock is provided with a cover plate, the front surface (11) of which is intended for receiving the bearing devices. <IMAGE>
