Abstract (en)

[origin: EP0404971A1] The invention relates to a method and a device for lifting, sinking and/or aligning a building, in which the building is aligned by means of a plurality of cylinder-piston units (1). The individual cylinder-piston units (1) are each actuated until the attainment of a load predetermined by the statics of the building for the position of the cylinder-piston unit (1), with the result that appropriate introduction of force into the foundations in accordance with the statics of the building is ensured both during and after the alignment process. <IMAGE>
