Abstract (en)

A unitary centrifuge tube and separable sediment dispenser (10) of plastics material comprises a generally tubular portion (12) with a conical taper connected by a short tube (22) to a sediment receptacle (24). The receptacle (24) is easily separable from the centrifuge tube by twisting the receptacle (24) and centrifuge tube (12) with respect to each other. A short segment of the connecting tube (22) remains attached to the sediment receptacle (24) and allows convenient dispensing of the enclosed sediment by squeezing two opposed walls (34 min) of the receptacle (24). A second pair of opposed transverse sidewalls (26 min) is designed to resist flexing during the separation.
