Abstract (en)

[origin: EP0405196A2] In a switch with several operating positions for switching electrical control parameters, in particular for motor vehicles, having a housing, having a switching section which is supported in the housing, having a cavity in the switching section which holds a compression spring and a contact part, having a first contact track which consists of a predetermined number of individual contact elements each of which can be connected via the contact part to a second continuous contact track which is arranged adjacent to the first contact track, in order that a predetermined voltage value is supplied in each operating position, the voltage value having tolerances which are as tight as possible, the contact elements of the first contact track are connected to one another via resistors, the first contact element is connected to a first connector, the last contact element is connected to a second connector, the first and the second connector are connected to a supply voltage and the second contact track is connected to a third connector. <IMAGE>
