Abstract (en)
[origin: EP0405252A2] The invention relates to a device for locking windows, doors or the like, having a baseplate (7) to be fastened especially to the frame and carrying an axle (10), about which can tilt a retaining plate (11), the tiltability of which is lockable by means of a blocking part (19) of a lock cylinder or the like. To achieve a simpler design which is easier to assemble, to satisfy the different fastening conditions occurring in practice and also to simplify any retrofitting, the invention proposes that the retaining plate (11) be arranged reversibly on the axle (10). <IMAGE>
