Abstract (en)  
[origin: EP0405595A1] A procedure for the continuous manufacturing of netting bags,an improved machine for the implementation of said procedure and the netting bags coming out therefrom of the type which is using a netting tube being cut at the ends to shape up closed containers after being filled. The process is generating the lateral feeding of bands of thermoweldable material for a concurrently application to the bags at their external and/or internal portions,in certain cases being determined thereby some areas of the thermoweldable materials without interruption from the bag head to the bag bottom; restricted areas to the bag head and bottom and head derived flaps. The band flowing circuit is external and/or internal from the netting body. Bands are cut by two horizontally actuated opposing movable knives, downwardly placed at the band guiding and driving area and at the entry into the machine of the bands.
