Abstract (en)
[origin: EP0405688A1] A switch, provided with a switch mechanism, consisting of a pair of contacts, an operating mechanism etc. has a carrier with supporting means for in general the complete switch mechanism and its fixed and movable parts, which carrier consists of a single in general plane and stiff supporting frame, onto one side of which the supporting means, such as shafts, cams, etc. can be applied and onto which the mechanism can be mounted in a functional way. A switch of this type is advantageous in that all parts of the switch mechanism can be placed by a robot onto one and the same side of the supporting frame, whereby these parts are being advanced by the robot towards that side in such a way that the displacements of the parts during advancing are parallel to each other.
