Abstract (en)

[origin: EP0406612A1] The realization is foreseen of concrete pipes (16), reinforced with preassembled cages (4), by means of the pressure vibration system, using a vertical nucleus (1) positioned coaxially to an external reinforcement (2), in which the compacting of the concrete is carried out by means of a vibrating part (7) of the head of the nucleus (1), which does not draw the material in rotation and therefore does not induce torsion in the reinforcement (4).
