Abstract (en)  
[origin: EP0406703A1] The invention relates to a slide for drawers or the like having at least one pair of rails, arranged on one of opposite side surfaces in each case, and consisting of a unit rail and a drawer rail, a running roller being arranged in each case at one end of the unit rail or the drawer rail, which running roller rolls off along horizontal webs arranged in each case on the opposite rail. In previously known slides of this type, four different types of rails are required. To simplify and reduce the costs of manufacture and storage of the individual rails of the slide and to facilitate assembly of the slide, the slide of the generic type is further developed in such a way that both the unit rail and the drawer rail consist of rails (1) which are symmetrical in mirror image relative to their central transverse axis (2) and thus identical, running rollers (4, 5) being arranged at both ends. <IMAGE>
