Abstract (en)
[origin: WO9008200A1] A metallurgical vessel (1) with several groups of flushing fluid injection elements (2, 3) arranged in the walls of the vessel can be rotated about a horizontal axis (5) into several operating positions. Different, preferably secondary metallurgical processing steps such as flushing or injection of solids can be carried out by means of two different groups of different flushing fluid injection elements (2, 3) at least one of which is located below the bath surface (6) in each operating position of the vessel (1).
