Abstract (en)

[origin: EP0407680A1] Prefabricated platform constituted by a section (1), each end of the section carrying a support (3) comprising a vertical member to which are fixed two suspension hooks (2) intended to be positioned and fitted around a horizontal tie-bar (8) of a construction. The vertical member is pierced through by at least one opening (4) having its horizontal axis located in the same vertical plane as the longitudinal axis as one of the suspension hooks (2). The abovementioned opening (4) permits the passage of the upper portion of a locking device (6) attached to the lower portion of the support (3) so as to be able to pivot in a vertical plane and so that when the corresponding suspension hook (2) is positioned over a horizontal tie-bar (8), the locking device (6) interacts with the lateral surface of the tie-bar (8) and bears against the latter. <IMAGE>
