Abstract (en)
[origin: WO8909591A1] Baby's bottle having a neck (12) with a mouth (10) and a teat with a horizontal flange supported by a ring seal which can be positioned on the neck (12) in a detachable way and engaged in the front side (18) of the mouth so as to seal it. Said ring seal (18) is articulated on the neck (12) and can be firmly linked to it in such a way that it pivots between its active operational position, where it presses the flange of the teat against the front side (18) of the mouth, and one of its passive operational positions, where the teat is positioned sideways relative to the front side (18) of the mouth (10) or neck, leaving the mouth open.
