Abstract (en)

[origin: EP0408871A2] The invention relates to a window or door having wings (1, 2) arranged in at least two planes, resting on runner rails (3, 4) and guided by guide rails (5, 6), at least one of which wings is slidable horizontally, the sealing arrangement in the central joint of the wings (1, 2) being effected in each case by a sealing bridge (11) arranged between the runner rails (3, 4) or flanges (7, 8) of the guide rails (5, 6) and comprising a sealing element (12) having sealing brushes (13). The sealing bridge (11) is secured on the frame (9) of the window or door and is guided to a substantially U-shaped collar made of soft material. In order to improve the stabilisation of the sealing bridge (11) and at the same time to facilitate the assembly thereof, it is proposed according to the invention that the sealing element (12) of the sealing bridge (11) is made of a hard material and that the sealing element (12) has projections (16) on the frame side, which engage in associated recesses (17) in the base (10') of the collar (10).
