Abstract (en)

[origin: EP0409046A1] In a sheet delivering device for printing machines, an auxiliary delivery table is inserted above the main sheet stack into the region of the sheets to be delivered in order to remove a main sheet stack (7) when the printing machine is running. In a region of the trailing edge of the stack, oscillating sheet stops (18, 19) are provided which align the trailing edge of the delivered sheets, in which arrangement they act simultaneously on the trailing edges of the sheets of the main stack (7) and on the trailing edges of the sheets (25) delivered onto the auxiliary stack table. <IMAGE>
