Abstract (en)
[origin: EP0409056A2] Device for conducting sterile liquids in a closed system, consisting of two puncturing mandrels (1, 2) which lie opposite one another and which have passing through them two channels (3, 4) extending in parallel and offset relative to one another, the channels in each case terminating with one end in the tip of one of the puncturing mandrels and with the other end (6, 7) in the flank of the other puncturing mandrel, and the whole system being surrounded by a sleeve (9) which is mounted on a centred baseplate (8) and which is closed off either at one end only or preferably at both ends by a filter (10, 11). In this way, it is possible to conduct liquid without any risk of contamination. <IMAGE>
