Abstract (en)

[origin: EP0409687A1] Method of improving the surface properties of steel articles, especially their surface hardness, according to which a steel article is prepared in the clean state; the article is heated in an oven under inert atmosphere to a predetermined silicidising temperature of between 800 DEG C and 1100 DEG C; a gaseous mixture of silane ( $\text{SiH}_{2n+2}$ ) and of argon is injected into the oven where the steel article maintained at this temperature is located, so as to form a diffusion layer containing 10 to 40% of silicon as atomic percentage at the surface of the steel article, the proportion by volume of silane in the gaseous mixture being preferably between 0.1 and 5%.
