Abstract (en)
[origin: EP0409720A1] Each supporting plate (5) consists of a substantially rectangular metal strip shaped at its centre (at 6), in order to mate with the thickened front face of a side member, and extended by plane portions pierced by aligned perforations (9) and terminal cut-outs (10), slashes (7) being provided in the central deformed region (6) in order to temporarily hold the supporting plate (5) before finally fixing this supporting plate on the side members by means of penetration components passing through the holes (8) provided at the specified locations of the central deformed region (6) of each support plate (5), the perforations (9) and the cut-outs (10) receiving, in pairs, fasteners (12) forming a holder for holding covering panels (20) constituting the cladding of the buildings in question. <IMAGE>
