Abstract (en)

A description is given of a movable emergency sign for roads, construction site signals and the like, of very small dimensions and therefore not very bulky for placing on motor vehicles. This sign is characterized by the fact that the elements of the supporting structure are of rotating, sliding and tip-up type, and extractable. The pedestal consists, in fact, of a base, generally of parallelepiped shape, from which is extracted in X shape a bar and, vertically, a self-winding signal on refractive fabric with rod anchorage. Two alternatives are described, one with only one central rod and the other with two lateral rods. In the first case, the indicator signal is inserted on one side only, while, in the second case, it may be inserted on both sides.
