Abstract (en)

[origin: EP0412445A2] The invention relates to a rail for structural engineering, which is to be embedded in concrete girders or same, for holding especially facade-lining elements by means of anchors projecting on the rail, and proposes, especially for cutting to length without the need for extra work on the part of the builder, that the fastening points of each anchor (1) are arranged in each case solely on one longitudinal side of the rail (1), and the anchor has substantially a V-shaped anchor contour with a V-apex (12) lying remote from the rail. <IMAGE>
