Abstract (en)

[origin: EP0412632A1] The invention relates to a latch holding apparatus of a handle for opening and closing a door, in which a latch (30) pivotally secured to a base (20) fixed to a door main body (1) is held in a locked position, whereby the handle (6) is placed in a locked state. The latch holding apparatus includes a pair of handle grips (24) in each of which a recess is formed for insertion of the handle, a pivot shaft (25) for turnably supporting the latch on the handle grips, and holding means (40) for holding the latch in the locked position when the handle is inserted into the handle grips, and turning the latch and holding it in an unlocked position when the handle is separated from the handle grips. The latch can be opened easily by hand. At closing, the latch can be held in the locked position automatically after insertion of the handle.
