Abstract (en)

[origin: WO8910204A1] Seal made of two drums (10, 11) coupled by means of a linking shaft (12). Said drums have on their surface a sealing strip arranged spirally. They are supported in casings parallel to the row of distribution apertures provided in the wall of the distributor. Said drums are mobile in the plane of the apertures and can be moved by a pushing device so as to press the sealing strip against a given number of apertures. A drum rotation control device is provided for selecting symmetrical aperture zones at different distances from the centre of the distributor.
