Abstract (en)
[origin: EP0414075A1] A device for filling containers, in particular bottles or cans, with a preset quantity of a liquid, especially a liquid under high pressure, is described. This device has a storage container (1) which maintains the liquid (2), to be introduced, under a high pressure and which contains a gas space (3) above the liquid level. Disposed in the storage container is a metering chamber (12), the lower part of which is constructed as a container attachment (4) and which has, on its outer side, guide means for guiding a centering and sealing bell (6) for coupling to containers (8) to be filled. The metering chamber (12) projects from below through the liquid (2) into the gas space (3) of the storage container (1). By means of a displacement member (16), the volume of the metering chamber (12) can be adjusted. The interior of the containers (8) can be connected either to the gas space (3) or, alternatively, to an additional gas space (27) of reduced pressure via a return-gas pipe (21), a return-gas connection (24) and a valve (26). <IMAGE>
