Abstract (en)

[origin: EP0414105A1] In a drainage device, specially for inclined glazing and glazed roofs constructed using mullions and transoms, there are arranged vertical and horizontal sealing profiles (2, 17) which, with sealing lips (15, 28) arranged on their inner edges, lie sealingly against infilling elements. The vertical sealing profiles (2) are arranged to extend over the entire vertical length of the construction and have at least one discharge channel running parallel to the centre line. The horizontal sealing profiles (17) likewise have a discharge channel (20) at their edge located at the top in the installed state, so that water collected in this channel is led away at the crossing points into the vertically extending sealing profiles and from these towards the outside. <IMAGE>
