Abstract (en)

[origin: JPH0398673A] PURPOSE: To evaporate the solvent of a liquid film on a moving substrate by taking the substrate along a web while freely suspending the substrate on a transporting cushion of a drying gas flowing with respect to the lower side of the substrate and evaporating the greater part of its solvent component by the heating and drying gas, then carrying the vapor of the solvent component from the upper side of the substrate. CONSTITUTION: Gas or air supplying systems 11, 12 are arranged both above and below the moving substrate 2. An applying device 5 applies the liquid film 3 on this moving substrate 2. The substrate 2 is taken while the substrate is freely suspended along the web on the transporting cushion generated by the gas or air supplying system 11 in the lower part through a drying zone 21.
