Abstract (en)

[origin: EP0414163A1] The invention relates to a permutation lock for suitcases, bags or the like, having a plurality of number discs (31) which are each rotatable on an axle (23) and each of which is assigned an actuating handle (24), and blocking sleeves (33) which are coupled to these and which can be uncoupled from the actuating handles (24) in order to vary the secret code, and, to achieve a small stable design, whilst at the same time preventing an unintentional self-adjustment of the secret code, proposes that the adjacent blocking sleeves (33) in toothed engagement with toothed rings (27) of the actuating handles (setting wheels 24) sit on axle journals (23) of a transversely and longitudinally displaceable carrier (34), the transverse displacement of the carrier (34) blocking or releasing the rotational movement of the blocking sleeves (33) and the longitudinal displacement coupling or uncoupling the toothed engagement. <IMAGE>
