Abstract (en)

[origin: US5037146A] A lock for a detachable vehicle body part, particularly a roof of a motor vehicle, includes a fixed receiving device and a movable actuating member. The actuating member, which is pivoted at a pin, has a circular plate with a circle segment-type flattening and is adjustable from a closed position to an open position and vice versa. The adjustments are accomplished by moving the actuating member along a circular path segment. In the closed position, the actuating member reaches over the receiving device.
