Abstract (en)
[origin: EP0415355A2] The invention relates to a locking means for a lock, especially a ring lock, which comprises a plug part (14) and a plug-part receptacle (16) having a catch device (22, 24, 30) actuable by a locking mechanism (32). The invention is characterised in that a catch body (22) is received in a guide passage (26) directed transversely relative to the direction of introduction of the plug part (14) and belonging to a catch-body guide element (24) and is located opposite a control surface (30) on its side remote from the introduced plug part (14), in a blocking position of the catch-body guide element (24) the control surface (30) urging the catch body (22) into engagement behind the catch shoulder (20) so as to block the pull-out movement of the plug part (14), furthermore the catch-body guide element (24) being displaceable by the entering plug part (14) by means of the catch body (22) into a first shifted-aside position, in which the catch body (22) is released by the control surface (30) for a shifting-aside movement, and the catch-body guide element (24) being rotatable as a result of the rotation of the locking mechanism (32) into a second shifted-aside position, in which the catch body (22) is released by the control surfaces (30) for a shifting-aside movement allowing the plug part (14) to be pulled out. <IMAGE>
