Abstract (en)  
[origin: EP0415495A2] The invention relates to a transformer for intermittent operation at a clock frequency, having a three-limbed core (12) consisting of iron oxide-ceramic, whose limbs (13, 15, 17) form windows (18, 19) through which primary and secondary windings (21, 23) are passed, the superimposed primary and secondary windings (21, 23) being isolated from one another by means of an earthed capacitive screen (2). The capacitive screen (2) consists of conductive screening conductor strips (5a, 5b) which are arranged parallel to one another, spaced apart on an insulating film (1), and are connected to one another by means of a connecting conductor strip (7a, 7b), ends (9a, 9b) of the screening conductor strips (5a, 5b) which lie side-by-side being electrically open-circuit, at least at one screening conductor strip end (9a, 9b). <IMAGE>
