Abstract (en)

[origin: EP0415507A1] A small rectangular transport pallet (1), made of corrugated cardboard blanks, gives access to lifting trucks in the longitudinal and transverse directions (S and M) with the aid of corresponding longitudinal and transverse loading channels (5b and 5a). In this case, the mid-axis (L) of the transverse loading channel (5a), provided between two parallel panel-type supports (3), is offset relative to the short axis of symmetry (M) of the pallet loading surface (2) and an edge flange (6) is provided which projects over the support (3) on the side of the axis of symmetry. In order to increase the strength of the pallet and to improve the pallet blanks in respect of material expenditure and processability, the supports (3) are provided as compact, closed support elements with openings forming the longitudinal loading channel (5b). <IMAGE>
