Abstract (en)  
[origin: EP0419788A2] In an adjustable foot rest for a seat arrangement of a motor vehicle, having a pivot lever which bears a foot plate, in order to achieve a constantly optimum position of the foot plate, with a view to anthropometric ergonomics, for a 5% woman and a 95% man for different seating settings, the pivot lever is mounted in a sliding element which can be displaced in the longitudinal direction in a mounting part held on the seat. The two-armed pivot lever bears at one end on its lever arm facing away from the foot plate a catch which engages in a toothed rack on the mounting part and thus locks the pivot lever in every displacement position of the sliding element on the mounting part. <IMAGE>
