Abstract (en)
[origin: EP0420001A1] In order, in a machine for mincing, in particular for meat or the like with two cutting sets (4, 5) arranged one behind the other in the direction of passage (3) of the material for cutting and each consisting of a perforated disc (7) and a rotating cutter (6), to improve the passage of the material for cutting through the machine, in particular in the area of the first cutting set, a retaining ring (12) is arranged, viewed in the direction of passage (3), at least in front of the first perforated disc (7). Said ring is equipped with a multiplicity of approximately radial retaining teeth (13), the width of the tooth gaps corresponding approximately to the tooth width viewed in the circumferential direction and the cutter element projecting into the retaining ring (12). It is advantageous that the cutter (6) has more than two, preferably five to twelve arms with at least one in-set interchangeable blade in each case. <IMAGE>
