Abstract (en)

[origin: EP0420359A1] Transport vehicle (1) with a loading space provided with a loading opening (3) and a container unloading device (4) comprising a container carrier (6), provided with gripping means (9) for gripping and supporting a container on a side and lifting means (15) connected to the container carrier for raising the container carrier to the loading opening. The container carrier comprises a first subframe (25) directly connected to the lifting means and, connected to the first sub-frame by vertical guiding means (8), a second sub-frame (32) bearing the gripping means, wherein the vertical guiding means permit only an at least practically vertical, parallel displacement of the second sub-frame relative to the first, and on one of both sub-frames a force sensor (34) is arranged on which the other sub-frame lies gripping in a downward direction and wherein processing means connected to the force sensor are arranged which can process an output signal delivered by the force sensor into a weight-value.
