Abstract (en)
[origin: EP0421047A1] Load control apparatus with a control element (11) capable of acting upon an actuator (12) determining the output of an internal combustion engine, which control element acts in concert with a driving carrier (3) coupled to an accelerator pedal (1) and in addition can be moved by means of an electrical servo drive (15), with a reference value detection element (7) assigned to the driving carrier, an actual value detection element (13) interacting with this and acting on the electrical servo drive, it being possible to control the electrical servo drive as a function of the values registered by an electronic control device (14). <??>In order to ensure movement of the control element producing no feedback reaction with regard to the driving carrier when the electrical servo drive is triggered, it is proposed according to the invention that a clutch (10) be arranged between driving carrier and control element. <IMAGE>
