Abstract (en)
[origin: EP0421836A1] Method of making a compound wood-metal section according to which there is disposed, parallel with each other, a metal section (2) and a wooden section (1) while keeping them separated and the space separating the said metal and wooden sections is filled with an adhesive binder (3) which can be hardened. According to the invention: - in one of the said sections, a first longitudinal relief element is formed (8, 17, 4A); - in the other of the said sections, a longitudinal fin (6, 6A, 6B) is formed, this fin being capable of covering the said space; - the said longitudinal fin comprises at its free edge a second longitudinal relief element (7,6C,6F) capable of cooperating with the said first longitudinal relief element in order to join the said metal and wooden sections by the fitting together of the said first and second relief elements; and - after hardening the said adhesive binder in the said space, the said fin connecting the said profiles is removed by machining. <IMAGE>
