Abstract (en)

[origin: EP0421943A1] An automatic take-up method and mechanism for loop warp threads consists of feeding the threads through the comb after taking from a magazine such as a bobbin a folding then in two. The head and tail of each folded section are then passed through a warping element and then between the teeth of the comb. The folded sections of each thread are of approx. the same length, with one section kept vertical and the other horizontal. A cord can be threaded through the loop formed by each foled thread to keep it under tension as it is passed through the warping element and comb.
