Abstract (en)
[origin: JPH03138896A] PURPOSE: To provide an electronic auxiliary switching device which can set the dimming of light in a region of specified ratios to normal luminous flux with a simple constitution and surely by increasing a resistance of a discharge section gradually, in the case of increasing the luminance of a fluorescent lamp and setting the resistance to the infinity in cutting off the discharge. CONSTITUTION: Upon adjustment of deviation RAW, which is derived by comparing a desired value SW and an actual value IW, at least one adjustment amount HMG is superposed, and the adjustment amount HMG is made to operate only on a lower limit of a luminance adjustment region of a fluorescent lamp LL. To this end, an auxiliary adjustment amount HMG is derived from a direct voltage at an electrode, which is not connected to a lamp choke coil L1 of the fluorescent lamp LL or from a light-emitting alternating voltage of the fluorescent lamp LL. Thus the switching device can set the dimming of light from the fluorescent lamp using a simple constitution and surely in a region from 10% down to 1% to nominal luminous flux.
