Abstract (en)
[origin: EP0422344A2] The invention relates to a doctor blade device, whose doctor blade, attached in a doctor blade holder, can be placed against a cylinder receiving ink, preferably the forme cylinder of a gravure printing machine. <??>To achieve the object of providing a doctor blade device of this type, in which the doctor blade can be pressed onto the cylinder with essentially the same contact pressure regardless of the length of the doctor blade holder, provision is made according to the invention for the doctor blade holder (117) to be connected rotatably by a plurality of journals (116) or the like, which are arranged at right angles to the longitudinal extension of said doctor blade holder, to an identical number of slide-type support pieces (113), which are guided displaceably in guides (114, 115) extending at right angles to the cylinder (120), and is pressed onto the cylinder (120) by a plurality of resilient pressing-on means, for example pressure medium piston cylinder units (121), which are distributed over the length of said doctor blade holder. <IMAGE>
