Abstract (en)

[origin: EP0422412A2] The device relates to a printing machine, in particular an offset printing machine having several printing units which, apart from one, are provided with a circumferential and lateral register-adjusting device for adjusting the register. For a simple and cost-effective construction, it is proposed that, for the effect of a register adjustment of the non-adjustable printing unit (5), a control command input device (16) is assigned to said printing unit in such a way that a relative change in position of the subject (20) of the non-adjustable printing unit (5) is effected by consequential register adjustments of the adjustable printing units (2, 3, 4). <IMAGE>
