Abstract (en)

[origin: EP0422568A2] The invention relates to a busbar (1) for making electrical contact with electrical apparatuses (47), consisting of a flat, elongated electrically insulating plastic profile (2) in which there are embedded, in the longitudinal direction, electrically conductive rigid conductors (5, 6, 7, 8, 9) which are completely surrounded by plastic material, the plastic profile (2) having groove-shaped recesses (3), which originate from a main surface, are spaced apart from one another, run at right angles to the longitudinal axis (30) of said profile and in each case expose the conductors over the width of the recess (3), which conductors make contact with contact elements (49, 50, 51, 52, 53) arranged on the apparatus and lined up with the conductors (5, 6, 7, 8, 9) when the apparatus (47) is fitted. In particular, the busbar (1) with additional signal lines is used within supporting rails (46) for snapping apparatuses (47) which require a signal line onto snap holders (56, 56'). <IMAGE>
