Abstract (en)
Control system for controlling the propulsion installation of a ship which during operation is propelled by at least two waterjets. The installation comprises actuators for controlling the direction of the waterjets in response to control signals, and a control unit for generating said control signals to said actuators. The system comprises furthermore means for detecting the momentaneous roll angle of the ship and/or means for detecting the momentaneous pitch angle of the ship. Detection signals from said means are supplied to the control unit which modifies the control signals such that the roll movement and/or pitch movement of the ship is counteracted.
