Abstract (en)

[origin: EP0424283A1] A positive thermal coefficient resistor (32) is inserted into one of the control circuits of a remote-control interrupter (10), in such a way as to switch over to a region of significant resistance when the control push-button (30) is kept in the closed position, and to interrupt the energising of the coil (21) ready to receive a new order, for example through a local control (26). <IMAGE>
