Abstract (en)

[origin: EP0424290A1] This device is of the type comprising a plurality of rollers (3), on which a sheet (6) is engaged astride them, and detectors (13) of the presence of one of the edges of the sheet (6), which are aligned horizontally at the desired positioning height of this edge. According to the invention, this device includes a pusher (15), on which act operating means (16a, 16b) displacing it in a rotational movement about a vertical axis passing through one of its ends, so that it bears on the sheet in order to cause it to slide on the rollers (3) until its free edge has desensitised all the presence detectors (19), after it has reached its desired correct position. The invention is used particularly in the sector of industrial laundry.
