Abstract (en)

An electrophotographic lithographic printing plate precursor, in which the effect by the hydrophilic property of non-image areas is further improved, and which is stable during storage even under very severe conditions and capable of readily realizing the hydrophilic property in a short time during processing of rendering hydrophilic is provided, which utilizes an electrophotographic photoreceptor comprising a conductive support having provided thereon at least one photoconductive layer and further provided thereon a surface layer as an outermost layer, wherein said surface layer comprises at least one resin containing at least one polymeric component having at least one of functional groups represented by the following General Formula (I) and General Formula (II): General Formula (I) $-W1 \text{ \&parstr\& } CH_2 \text{ \&parstr\& } @@CH=CH_2$ General Formula (II) $-W2 \text{ \&parstr\& } CH_2 \text{ \&parstr\& } @@CH_2CH_2-X$ wherein $-W1-$ and $-W2-$ each represent $-SO_2-$, $-CO-$ or $-OOC-$, n_1 and n_2 each represent 0 or 1 and X represents a halogen atom.
