Abstract (en)

[origin: EP0425803A1] A device for delivering a sliver running via conveying devices of a feed table to a textile-processing machine, the conveying path of the sliver being assigned, in a position of readiness, a reserve sliver which, in the event of a break or run-off of the sliver, can be cut in by a control unit in such a way that the start of the reserve sliver can be attached to the end of the sliver running off, is to be improved in terms of its mode of operation. For this, the separately running conveying paths (18, 18a) of the sliver (12) and reserve sliver (12a) are assigned a common nip (47), and the sliver and the start of the reserve sliver can be delivered to the nip next to one another. In addition, rollers (44, 48) on roller axes extending approximately perpendicular to the conveying path (18) of the sliver (12) are to limit the nip as a roller nip (47). <IMAGE>
