Abstract (en)
[origin: EP0427148A2] A discharging device for containers, in particular for bottles, for use in container cleaning machines, has a plurality of slide guides which each form a convexly curved support and slide surface for the containers, and with which in each case at least one pick-up finger is associated, which finger forms together with a pick-up end protruding beyond the respective slide surface a support surface for the bottom of a container when it is lowered along the corresponding slide guide onto a deposit surface. Each slide guide consists of an upper and lower section, only the lower section of which being movable in order to push over the containers from the deposit surface onto an adjacent transporter between an initial position and a push-over position. As a result, even with high machine powers, reliable pushing-over of the containers is ensured without the risk of the containers falling over.
