Abstract (en)

[origin: EP0427621A1] This plant comprises a production bench (1) bearing elements which are capable of carrying out the subdivision of a single casting of concrete into a number of separate slabs (3), each of which is suitable for one of the cell-like elements to be made. These subdivision elements are fixed in a removable manner on the production bench (1) with the aid of fixing means making it possible to immobilise them in different positions, as a function of the width envisaged for these cell-like elements. At their ends, these subdivision elements (4) have a device for temporary immobilisation of the two prefabricated panels (19) arranged on either side, each of these devices comprising a post (20), the base of which can be fixed in an adjustable position on the corresponding subdivision element, and an external prop (21) of adjustable length. <??>This plant is intended for making a series of cell-like elements constituting a single building unit, for example a house or a building level. <IMAGE>
