Abstract (en)

[origin: EP0427667A1] The present invention relates to a deflecting coupling sleeve (6) for suspended tubular rails. The sleeve (6) has a zone located between two inner shoulders (75 and 76) formed from inclined guide faces (77, 67) allowing a roller-type or castor-type mounting to be displaced perpendicularly to the direction of linear displacement, the rolling faces (67a) likewise being inclined to allow the displacement of said mounting in another direction. The consequence of the resultant of these two displacements and of the linear displacement of the mounting is that the device suspended by means of said mounting executes a complex displacement allowing it to pass from a passive state to an active state and vice versa. Such sleeves can advantageously be used for the hermetic closing of the apertures of refrigeration rooms. <IMAGE>
